Step-by-Step Guide to Handwriting Image Processing in MATLAB

- Image Acquisition and Loading

Begin by importing the handwritten image into MATLAB.

```
```matlab

% Load the handwritten image

img = imread('handwritten_sample.png');

% Convert to grayscale if the image is in color

if size(img, 3) == 3

img_gray = rgb2gray(img);

else

img_gray = img;

end

imshow(img_gray);

title('Original Grayscale Handwritten Image');

```
```

- Preprocessing: Noise Removal and Binarization

Preprocessing enhances image quality for subsequent analysis.

- Noise Removal: Use median filtering
- Binarization: Convert image to binary (black and white)

```
```matlab
```

```
% Remove noise

img_filtered = medfilt2(img_gray, [3 3]);

% Binarize image using Otsu's method

threshold = graythresh(img_filtered);

img_binary = imbinarize(img_filtered, threshold);

% Invert image if necessary (handwritten text is usually black on white)

img_binary = ~img_binary;

figure;

subplot(1,2,1); imshow(img_gray); title('Filtered Grayscale');

subplot(1,2,2); imshow(img_binary); title('Binary Image');

...

- Segmentation: Isolating Characters
```

Segmentation isolates individual characters or words for recognition.

- Connected Components Labeling: Identify separate characters

```
```matlab
```

```
% Label connected components

cc = bwconncomp(img_binary);

% Extract bounding boxes

stats = regionprops(cc, 'BoundingBox');

% Display segmented characters
```

```
figure; imshow(img_binary); hold on;

for k = 1:length(stats)

rectangle('Position', stats(k).BoundingBox, 'EdgeColor', 'r');

end

title('Segmented Characters with Bounding Boxes');

hold off;

```
```

#### - Extracting Features from Characters

Features are essential for character classification.

- Common features include: area, perimeter, aspect ratio, moments, histograms, etc.

```
```matlab
```

```
features = [];

for k = 1:length(stats)

% Extract individual character image

character_img = imcrop(img_binary, stats(k).BoundingBox);

% Resize to standard size

character_resized = imresize(character_img, [28 28]);

% Flatten image to feature vector

feature_vector = double(character_resized(:));

features = [features; feature_vector];
```

end

```

### - Recognizing Handwritten Characters

Recognition involves training a classifier on labeled data.

Example: Using k-Nearest Neighbors (k-NN)

```matlab

% Assuming you have training features and labels

% load('trainingData.mat'); % Contains trainFeatures and trainLabels

% For demonstration, suppose trainFeatures and trainLabels are available

% knn model

mdl = fitcknn(trainFeatures, trainLabels, 'NumNeighbors', 3);

% Predict each character

predicted_labels = predict(mdl, features);

```

## Implementing a Complete Handwriting Recognition System in MATLAB

Building an end-to-end system involves integrating all steps into a user-friendly interface.

### - Designing the User Interface

Use MATLAB's App Designer or GUIDE to create buttons for:

### - Loading images

- Preprocessing
  - Segmentation
  - Recognition
  - Displaying results

img = imread(image_path);

img_gray = preprocessImage(img);

img_binary = binarizeImage(img_gray);

cc = segmentCharacters(img_binary);

features = extractFeatures(cc, img_binary);

labels = recognizeCharacters(features);

displayResults(cc, labels);

end

```
```

## Core Components of Handwriting Image Processing

- Image Acquisition and Loading

Before processing begins, the system must load the handwritten image, which can be captured via

scanner, camera, or existing file.

```
```matlab
```

```
img = imread('handwritten_sample.png'); % Load image
```

```
imshow(img); % Display the original image

```

Handling different formats (JPEG, PNG, TIFF) is straightforward, and converting color images to grayscale simplifies subsequent steps.

```
```matlab
```

```
if size(img, 3) == 3
```

```
    gray_img = rgb2gray(img);
```

```
else
```

```
    gray_img = img;
```

```
end
```

```
```
```

### - Image Preprocessing

Preprocessing enhances image quality, reduces noise, and prepares it for segmentation.

Key techniques include:

#### - Noise Reduction:

Median filtering (`medfilt2`) removes salt-and-pepper noise, which is common in scanned images.

#### - Contrast Enhancement:

Using `imadjust` or `histeq` improves the distinction between handwriting strokes and background.

- Binarization:

Thresholding converts grayscale images into binary images, separating ink from background.

```
```matlab
```

```
% Apply median filter
```

```
filtered_img = medfilt2(gray_img, [3 3]);
```

```
% Histogram equalization
```

```
enhanced_img = histeq(filtered_img);
```

```
% Binarization using Otsu's method
```

```
level = graythresh(enhanced_img);
```

```
binary_img = imbinarize(enhanced_img, level);
```

```
% Invert image if necessary (text should be white)
```

```
binary_img = ~binary_img;
```

```
figure; imshow(binary_img); title('Binary Handwriting Image');
```

```
```
```

- Image Segmentation

Segmentation isolates individual characters or words, vital for accurate recognition.

Methods include:

- Connected Component Labeling:

Detects connected regions representing characters.

- Line and Word Segmentation:

Uses horizontal and vertical projection profiles to segment lines and words.

```
```matlab

% Label connected components

cc = bwconncomp(binary_img);

stats = regionprops(cc, 'BoundingBox');

% Display bounding boxes

figure; imshow(binary_img); hold on;

for k = 1:length(stats)

rectangle('Position', stats(k).BoundingBox, 'EdgeColor', 'r');

end

hold off;

```
```

- Projection Profiles:

Sum pixel values along axes to find boundaries between lines and words.

```
```matlab

% Horizontal projection for line segmentation

horizontal_sum = sum(binary_img, 2);

% Find valleys to segment lines
```

```

### - Feature Extraction

Extracting meaningful features from each segmented character is crucial for classification. Features can be geometric, statistical, or structural.

Common features include:

### - Shape Descriptors:

Area, perimeter, aspect ratio, bounding box dimensions.

### - Histograms of Oriented Gradients (HOG):

Capture edge directionality.

### - Zoning Features:

Divide character into zones and compute pixel densities.

```matlab

% Example: Compute area and perimeter

for k = 1:length(stats)

char_img = imcrop(binary_img, stats(k).BoundingBox);

area = bwarea(char_img);

perimeter = bwperim(char_img);

% Additional features...

end

```
'''
```

- Character Classification

Using features, the next step is recognition via machine learning models.

Popular classifiers in MATLAB:

- K-Nearest Neighbors (KNN)
- Support Vector Machines (SVM)
- Neural Networks (MLP, CNN)

Sample SVM training:

```
```matlab

% Assuming features and labels are prepared

svmModel = fitcsvm(trainingFeatures, trainingLabels);

predictedLabels = predict(svmModel, testFeatures);

'''
```

For improved accuracy, deep learning models like Convolutional Neural Networks (CNNs) can be trained on labeled datasets such as MNIST.
