Question What is the primary function of the circulatory system? The primary function of the circulatory system is to transport blood, nutrients, oxygen, and hormones throughout the body and remove waste products. Name the main components of the respiratory system. The main components of the respiratory system are the nose, pharynx, larynx, trachea, bronchi, lungs, and alveoli. What is the role of the alveoli in the respiratory system? Alveoli are tiny air sacs in the lungs where gas exchange occurs, allowing oxygen to enter the blood and carbon dioxide to be removed. Define 'blood pressure' and its significance. Blood pressure is the force exerted by circulating blood

Red blood cells carry oxygen from the lungs to body tissues and return carbon dioxide from tissues to the lungs for exhalation. Explain the term 'respiration' in the context of the respiratory system. Respiration is the process of gas exchange where oxygen is taken into the body and carbon dioxide is expelled, primarily occurring in the lungs. What vocabulary terms are essential to understanding the flow of blood through the heart? Key terms include atria, ventricles, valves, aorta, pulmonary arteries, and vena cava, which describe the chambers, pathways, and structures involved in blood circulation.
