Eddy Current (for Non-Ferrous Metals)

- For non-ferrous substrates such as aluminum, copper, or zinc, the gauge uses eddy current technology.
- An alternating magnetic field induces eddy currents in the substrate.
- The device measures the impedance change caused by the coating and substrate interaction to determine thickness.

Calibration and Zeroing

- Prior to measurement, the device must be calibrated using a standard calibration block or specimen with a known coating thickness.
- Zeroing the instrument ensures that the measurement starts from a baseline, accounting for any surface irregularities or environmental factors.

Measurement Procedure

- Select the appropriate mode based on the substrate type.
- Calibrate the device if necessary.
- Place the probe firmly against the coated surface, ensuring good contact.
- Press the measurement button, and wait for the reading to stabilize.
