Sample Problem and Solution Breakdown

To illustrate the practical application of Hibbler solutions, consider a typical problem:

Problem:

A simply supported beam of length 6 meters carries a uniform load of 10 kN/m. Determine the maximum bending stress in the beam if its cross-sectional moment of inertia is $8 \times 10^6 \, \text{mm}^4$ and the distance from the neutral axis to the outer fiber is 50 mm.

Solution Steps:

Step 1: Calculate the Maximum Bending Moment

For a uniformly loaded simply supported beam, the maximum bending moment occurs at the center:

\[

$$M_{max} = \frac{w L^2}{8}$$

where:

- $w = 10\, \text{kN/m} = 10\, \text{kN/m}$
- $L = 6\, \text{m} = 6000\, \text{mm}$

$$M_{max} = \frac{10 \times 6000^2}{8} = \frac{10 \times 36,000,000}{8} = 45,000,000\, \text{N·mm}$$

Step 2: Calculate the Bending Stress

The maximum bending stress is given by:

$$\sigma_{max} = \frac{M_{max} c}{I}$$

where:

- $c = 50\, \text{mm}$
- $I = 8 \times 10^6\, \text{mm}^4$

$$\sigma_{max} = \frac{45,000,000 \times 50}{8 \times 10^6} = \frac{2,250,000,000}{8,000,000} = 281.25\, \text{MPa}$$

Result: The maximum bending stress in the beam is approximately 281.25 MPa.
