changes. Here are some examples:

What causes a substance to change phases?

Changes in temperature and pressure alter the energy of particles, leading to phase transitions when certain conditions are met.

Why does the temperature remain constant during melting or boiling?

Because the energy added during these processes is used to break intermolecular forces, not to increase temperature, hence the temperature stays constant until the phase change completes.

How can pressure affect boiling point?

Increasing pressure raises the boiling point, while decreasing pressure lowers it, which is why water boils at lower temperatures at higher altitudes.

What is a supercritical fluid?

It is a state of matter beyond the critical point where the substance exhibits properties of both liquids and gases, and the gizmo demonstrates how conditions can lead to this phase.
