Introduction to Geopolymer Chemistry

Geopolymers are inorganic polymers formed through the alkali activation of aluminosilicate raw materials, such as fly ash, metakaolin, or slag. Unlike conventional cement, which relies on calcium silicates to hydrate and harden, geopolymers develop their strength predominantly through the polycondensation of silica and alumina units in alkaline environments. The third edition of Geopolymer Chemistry and Applications provides an exhaustive overview of the underlying chemical principles governing these processes, grounding the discussion in both classical and contemporary scientific theories.

Historical Context and Evolution of Geopolymer Science

The book traces the origins of geopolymer research back to the pioneering work of Joseph Davidovits in the 1970s, who first coined the term "geopolymer" and demonstrated their potential as sustainable building materials. It then chronicles key milestones, including the elucidation of the chemical mechanisms, the development of standardized synthesis protocols, and the expansion of applications beyond construction into waste immobilization, fireproofing, and more.
