Sample Keystone Practice Questions with Answers

Below are some representative practice questions along with comprehensive solutions to illustrate effective problem-solving strategies.

Question 1: Draw the structure of the major product formed when 2-bromopropane reacts with hydroxide ion.

Answer:

Step 1: Identify the reaction type.

The reaction involves 2-bromopropane, a primary alkyl halide, reacting with hydroxide (OH^-). This suggests a nucleophilic substitution, most likely $\text{S}_\text{N}2$ due to the primary halide.

Step 2: Recall $\text{S}_\text{N}2$ mechanism.

$\text{S}_\text{N}2$ reactions proceed via backside attack, leading to inversion of configuration if the carbon is chiral.

Step 3: Predict the product.

Hydroxide will attack the carbon bonded to bromine, displacing bromide.

Step 4: Draw the structure.

- Starting material: $\text{CH}_3\text{CHBrCH}_3$
- Product: $\text{CH}_3\text{CH(OH)CH}_3$ (isopropanol)

Final answer: The major product is isopropanol (2-propanol).

Question 2: Determine the stereochemistry of the product when (R)-2-bromobutane undergoes elimination with KOH.

Answer:

Step 1: Recognize the reaction.

Elimination with KOH (a strong base) on a secondary halide suggests E2 elimination.

Step 2: Identify the possible products.

Elimination can produce alkenes with different stereochemistry: E or Z isomers.

Step 3: Determine the most likely product.

The major product typically follows Zaitsev's rule, favoring the more substituted alkene.

Step 4: Analyze stereochemistry.

- The (R)-configuration at the chiral center indicates the original stereochemistry.
- During E2 elimination, the leaving group and a hydrogen atom anti-periplanar are removed.

Step 5: Draw the product.

The elimination results in but-2-ene with stereochemistry depending on the anti-periplanar hydrogen.

Final answer:

The major product is (E)-but-2-ene, with stereochemistry determined by the anti-periplanar hydrogen abstraction.

Question 3: Propose a retrosynthetic pathway for synthesizing 3-methylpentane from simpler starting materials.

Answer:

Step 1: Identify the target molecule's key features.

3-methylpentane is a branched alkane with a methyl group on the third carbon of a pentane chain.

Step 2: Break down the molecule retrosynthetically.

Possible disconnections include:

- C-C bonds at the branching point.
- Using alkyl halides or alkenes as starting materials.

Step 3: Plan a synthetic route.

One approach:

- Start with pentane (C₅H₁₂).
- Perform alkylation to introduce the methyl group at C3.

Step 4: Practical synthesis pathway:

- Start with pentane as the main chain.
- Hydroboration-oxidation of 2-methylpentene (if prepared via alkene synthesis) to introduce the methyl group.
- Alternatively, alkylation of pentane with methyl iodide (CH₃I) under radical conditions to substitute at the appropriate position.

Final pathway:

- Synthesize 3-methylpentane via free radical alkylation starting from pentane and methyl iodide, with appropriate reaction conditions.
